

Given the tables `users` and `rides`, write a query to report the distance traveled by each user in descending order.

`users` table

Column	Type
<code>id</code>	INTEGER
<code>name</code>	INTEGER

<code>rides</code> table	
Column	Type
<code>id</code>	INTEGER
<code>passenger_user_id</code>	INTEGER
<code>distance</code>	FLOAT

`users`

id	username	name	sex	address	mail
1	wfarley	Gregory Rhodes	M	124 Marvin Roads Suite 683 New Nicole, MO 77702	mcastillo@yahoo
2	scottromero	Michele Craig	F	7070 Melinda Plains Suite 228 North Jamesside, MD 45566	xlane@gmail.com
				07598 William	

`rides`

id	passenger_user_id	start_dt	end_dt	distance	ride_region	is_com
1	31	2020-08-02 02:29:35	2021-12-17 02:29:35	4	SF	1
2	92	2020-08-30 03:05:09	2027-02-13 03:05:09	18	SF	1
3	80	2020-01-27	2023-09-11	5	SF	1

Solution

```
select a.name,sum(distance) as distance_traveled  
  
from users a left join rides b  
  
on a.id=b.passenger_user_id  
  
group by 1  
  
order by sum(distance) desc;
```

The above solution has thrown this error

Your output for test case #1	
name	distance_traveled
Thomas Miller	22
Tammy James	9
Courtney Stevenson	8
Winston Dunn	5
James Cain	

Correct output for test case #1	
name	distance_traveled
Thomas Miller	22
Tammy James	9
Courtney Stevenson	8
Winston Dunn	5
James Cain	0

```
select a.name,coalesce(sum(distance),0) as distance_traveled  
  
from users a left join rides b  
  
on a.id=b.passenger_user_id  
  
group by 1  
  
order by sum(distance) desc;
```

Note: You can't use **case** statement with **isnull** here it wont work in mysql

COALESCE IMPORTANCE -->

```
select *, coalesce(user_id, userid2,userid3) as coalesce_importance from coalesce_ex1
```

Note: IT WORKS only when there are **NULL** values in the table

user_id	userid2	userid3	coalesce_importance
1	0	0	1
	0	0	
0	1	0	0
		1	
	1		
		1	
0			0
	1	0	
		1	
	1	0	
NULL	0	0	0
